

# Chapter 4: Selection of an appropriate project approach

NET481: Project Management

Afnan Albahli

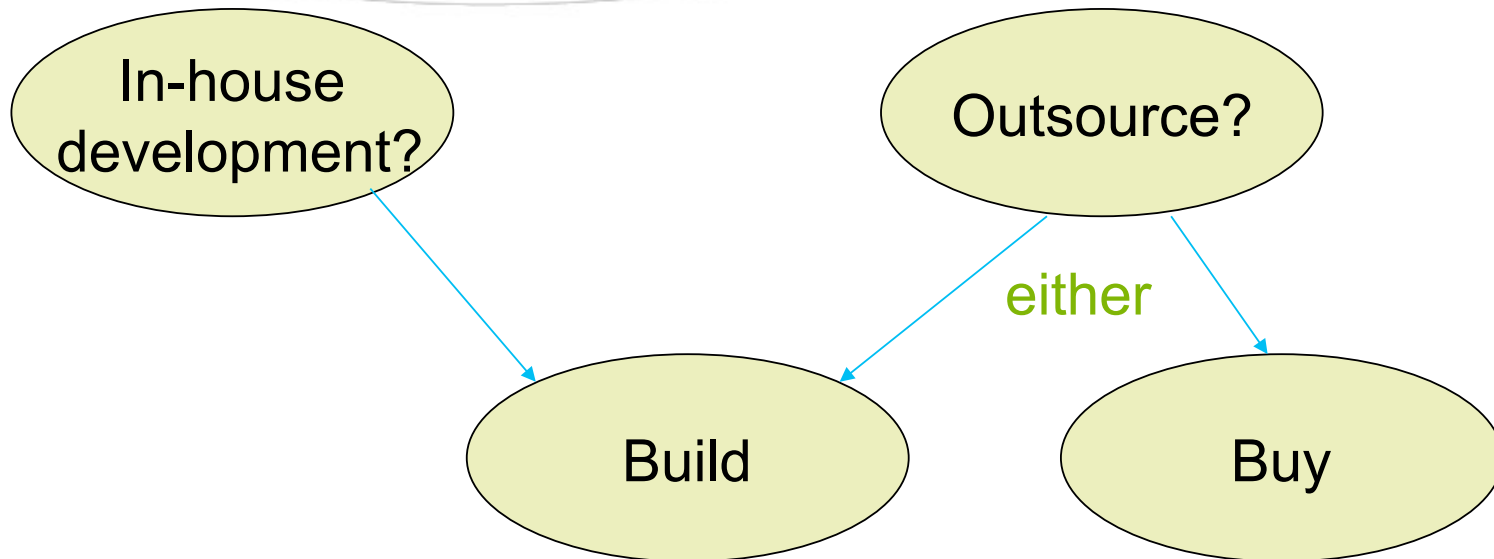

# Outline of lecture

- ◆ Building OR buying software
- ◆ Taking account of the characteristics of the project
- ◆ Process models
  - ◆ Waterfall
  - ◆ Prototyping and iterative approaches
  - ◆ Incremental delivery
- ◆ Agile approaches

# Selection of project approaches

- ◆ This lecture concerned with choosing the right approach to a particular project: variously called *technical planning*, *project analysis*, *methods engineering* and *methods tailoring*
- ◆ In-house: means that the developers and the users of the software are in the same organization.
  - ◆ often the methods to be used dictated by organizational standards
- ◆ Suppliers: : means that the developers and the users of the software are in the different organization.
  - ◆ need for tailoring as different customers have different needs

# Build or buy?

# In-House

## **Developing a new IT application in-house:**

- ◆ Time is needed to develop the software
- ◆ Would often require the recruitment of new technical staff to do the job
- ◆ Usually, the new staff won't be needed after the project is completed
- ◆ Sometimes due to the novelty of the project there may be lack of executives to lead the effort

# Outsourcing

**Contracting the project out to an external IT development company (outsourcing):**

- ◆ Time is needed to develop the software
- ◆ The conducting company will have technical and project expertise not readily available to the client
- ◆ The client would still do management effort to establish and manage the contracts

## Some advantages of off-the-shelf (OTS) software

- ◆ Cheaper as supplier can spread development costs over a large number of customers
- ◆ Software already exists
  - ◆ Can be trialled by potential customer
  - ◆ No delay while software being developed
- ◆ Where there have been existing users, bugs are likely to have been found and eradicated

## Some possible disadvantages of off-the-shelf

- ◆ Customer will have same application as everyone else: no competitive advantage, *but* competitive advantage may come from the *way* application is used
- ◆ Customer may need to change the way they work in order to fit in with OTS application
- ◆ Customer does not own the code and cannot change it
- ◆ Danger of over-reliance on a single supplier

# Steps of Project Analysis

- ◆ Identify project as either objective driven or product driven.
- ◆ Analyze other project characteristics by asking:–
  - ◆ Will we implement a data-oriented or a process oriented system?
  - ◆ Will the software to be produced be a general tool or application specific?
  - ◆ Are there specific tools available for implementing the particular type of application?
    - ◆ E.g.: – does it involve concurrent processing?
    - ◆ Is the system knowledge-based?
    - ◆ Will the system to be produced makes heavy use of computer graphics?

# Steps of Project Analysis (cont'd)

- ◆ Is the system to be created safety critical?
- ◆ Is the system designed to carry out predefined services or to be engaging and entertaining?
- ◆ What is the nature of the hardware/software environment in which the system will operate?

# Steps of Project Analysis (cont'd)

- ◆ Identify high-level project risks.
- ◆ The more uncertainty in the project the more the risk that the project will be unsuccessful.
- ◆ Recognizing the area of uncertainty allows taking steps towards reducing its uncertainty.
- ◆ Uncertainty can be associated with the products, processes, or resources of a project.

# Steps of Project Analysis (cont'd)

- ◆ **Product uncertainty:**

- ◆ How well are the requirements understood.
- ◆ The users themselves could be uncertain about what the system is to do.

- ◆ **Process uncertainty:**

- ◆ For the project under consideration, the organization will use an approach or an application building-tool that it never used before.

- ◆ **Resource uncertainty:**

- ◆ The main area of resource uncertainty is the availability of the staff with the right ability and experience.

# General approach

- ◆ Look at risks and uncertainties e.g.
  - ◆ are requirements well understood?
  - ◆ are technologies to be used well understood?
- ◆ Look at the type of application being built e.g.
  - ◆ information system? embedded system?
  - ◆ criticality? differences between target and development environments?
- ◆ Clients' own requirements
  - ◆ need to use a particular method

# Structure versus speed of delivery

## Structured approach

- ◆ Also called 'heavyweight' approaches
- ◆ Step-by-step methods where each step and intermediate product is carefully defined
- ◆ Emphasis on getting quality right first time
- ◆ Example: use of UML (Unified Modelling Language )
- ◆ Future vision: Model-Driven Architecture (MDA). UML supplemented with Object Constraint Language, press the button and application code generated from the UML/OCL model

# Structure versus speed of delivery

## Agile methods

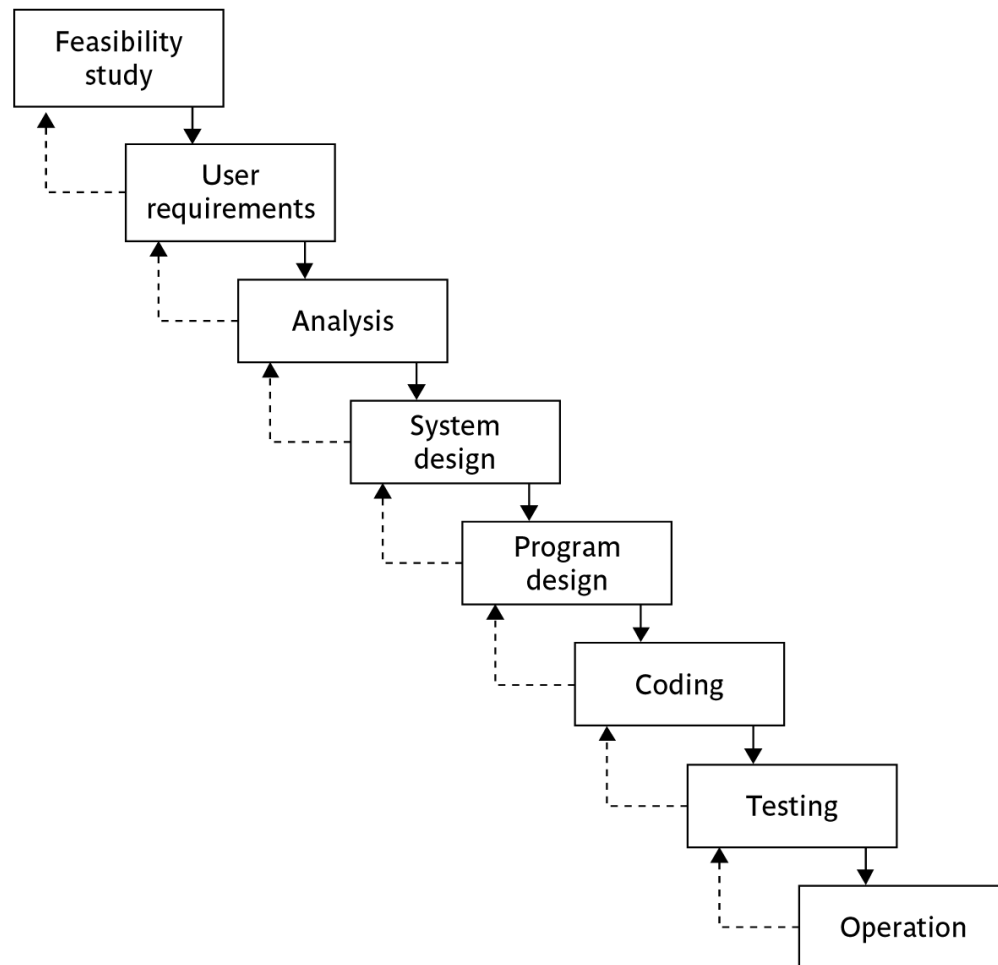

- ◆ Emphasis on speed of delivery rather than documentation
- ◆ RAD Rapid application development emphasized use of quickly developed prototypes
- ◆ JAD Joint application development. Requirements are identified and agreed in intensive workshops with users

# Software Process Models

- ◆ Waterfall Model.
- ◆ V-process Model.
- ◆ Spiral Model.
- ◆ Software prototyping.
- ◆ Phased Development Model.
  - ◆ incremental development model.
  - ◆ iterative development model.

# Waterfall

# Waterfall

- ◆ Classical model of system development.
- ◆ Called one-shot or once-through model.
- ◆ limited scope of iteration. Is this a strength or a limitation??
  - ◆ This is a strength for the WF-model.
  - ◆ Because it is suitable for some projects especially for large projects, we want to avoid reworking tasks that are thought to be completed.
  - ◆ Reworking tasks could result in late delivery.
- ◆ Suitable for systems with well defined requirements.
- ◆ Not suitable for systems of high uncertainty

# V-process Model

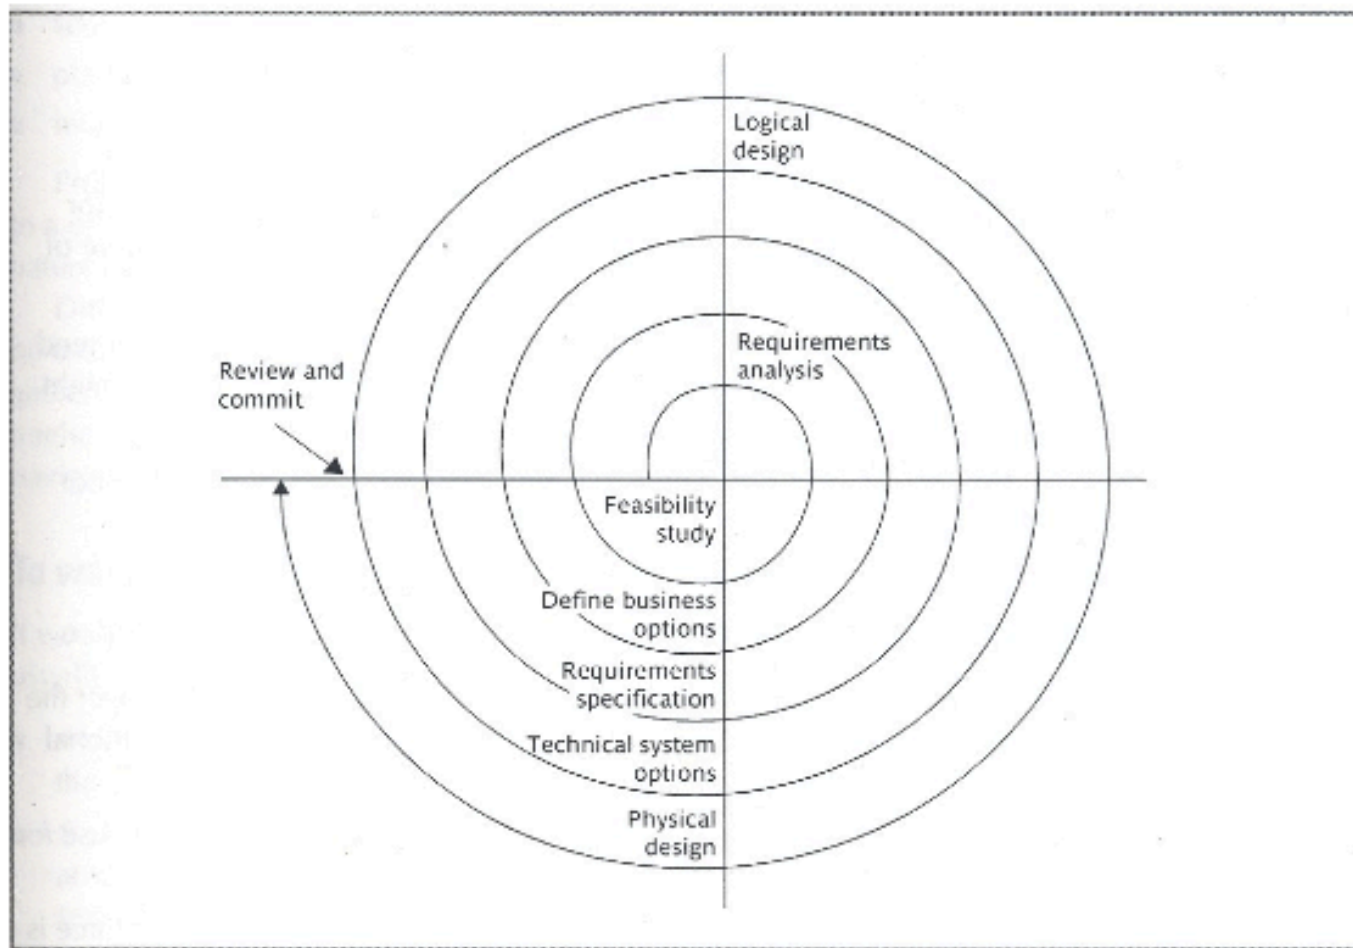

- ◆ An extension of the waterfall model.
- ◆ V-process model expands the activity box “testing” in the waterfall model.
- ◆ Each step has a matching validation process.
- ◆ Validation process can cause a Loop back to the corresponding stage and reworking the following steps in case of discrepancy.

# Spiral Model

- ◆ A greater level of detail is considered at each stage of the project.
- ◆ Represented as a loop or a spiral where the system is considered in more detail.
- ◆ This means **greater confidence** about the probability of success.
- ◆ Each sweep is terminated by an evaluation before the next iteration is embarked upon.

# Spiral Model (cont'd)

# Prototyping Model

- ◆ **Prototype** is a working model of one or more aspects of the projected system.
- ◆ **Goal**
  - ◆ Gain knowledge
  - ◆ reduce risk and uncertainty
  - ◆ verify a design or implementation approach

**The prototype is constructed and tested, quickly and inexpensively to test assumptions.**

# Classification of a Prototype

- ◆ **Throw-away**

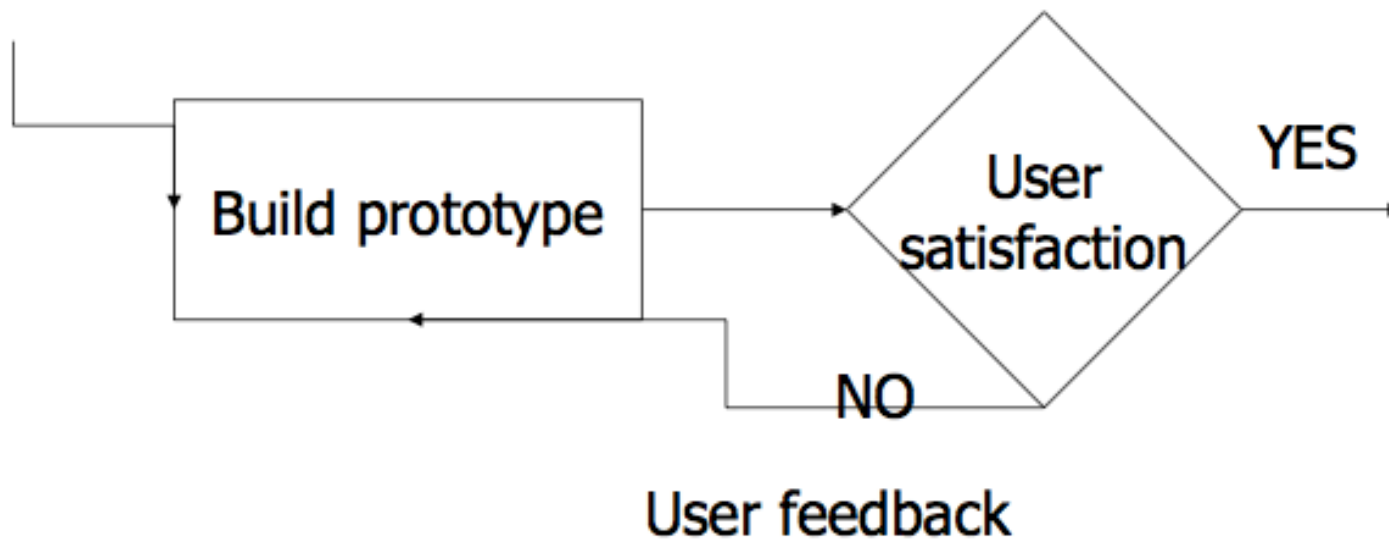

- ◆ Tests out some ideas.
- ◆ Discarded when the true development of the operational system is started.
- ◆ The prototype could be developed using a different SW and HW environment than those that will be used for the final system.

- ◆ **Example: user interface**

- ◆ **Prototype** :use a desktop application builder to produce an acceptable user interface.
- ◆ **Final system**: use a procedural programming language.

# Prototyping Model

# Benefits of Prototyping

- ◆ Learning by doing.
- ◆ Improved communication.
- ◆ Improved user involvement.
- ◆ Clarification of partially-known requirements.
- ◆ Demonstration of the consistency and completeness of a specification

# Benefits of Prototyping (cont'd)

- ◆ Reduced need for documentation.
- ◆ Reduced maintenance costs.
- ◆ Feature constraint.

# Drawbacks of Prototyping

- ◆ Users sometimes misunderstand the role of the prototype.
- ◆ Lack of project standards possible.
- ◆ Lack of control.
- ◆ Additional expense.
- ◆ Machine efficiency.
- ◆ Close proximity of developers.

# Prototypes at Different Stages

- ◆ Different projects will have uncertainties at different stages.
- ◆ Thus, prototypes can be used at different stages.

## Examples:

**At the requirements gathering stage:** to pin down requirements that seem blurred and shifting.

**At the design stage:** to test out the user's ability to navigate through a sequence of input screens.

# To what extent is the prototyping done?

- ◆ **The prototyping usually simulates only some aspects of the target application, thus there might be:**
  - ◆ **Mock-ups**
    - ◆ e.g. Copies of input screens shown to the users on a terminal.
    - ◆ They cant actually be used.
  - ◆ **Simulated interaction**
    - ◆ A user can type in a request to see a record in a database and an example of a result is shown.
    - ◆ There is no real access is made to the database.

# Forms of Prototypes

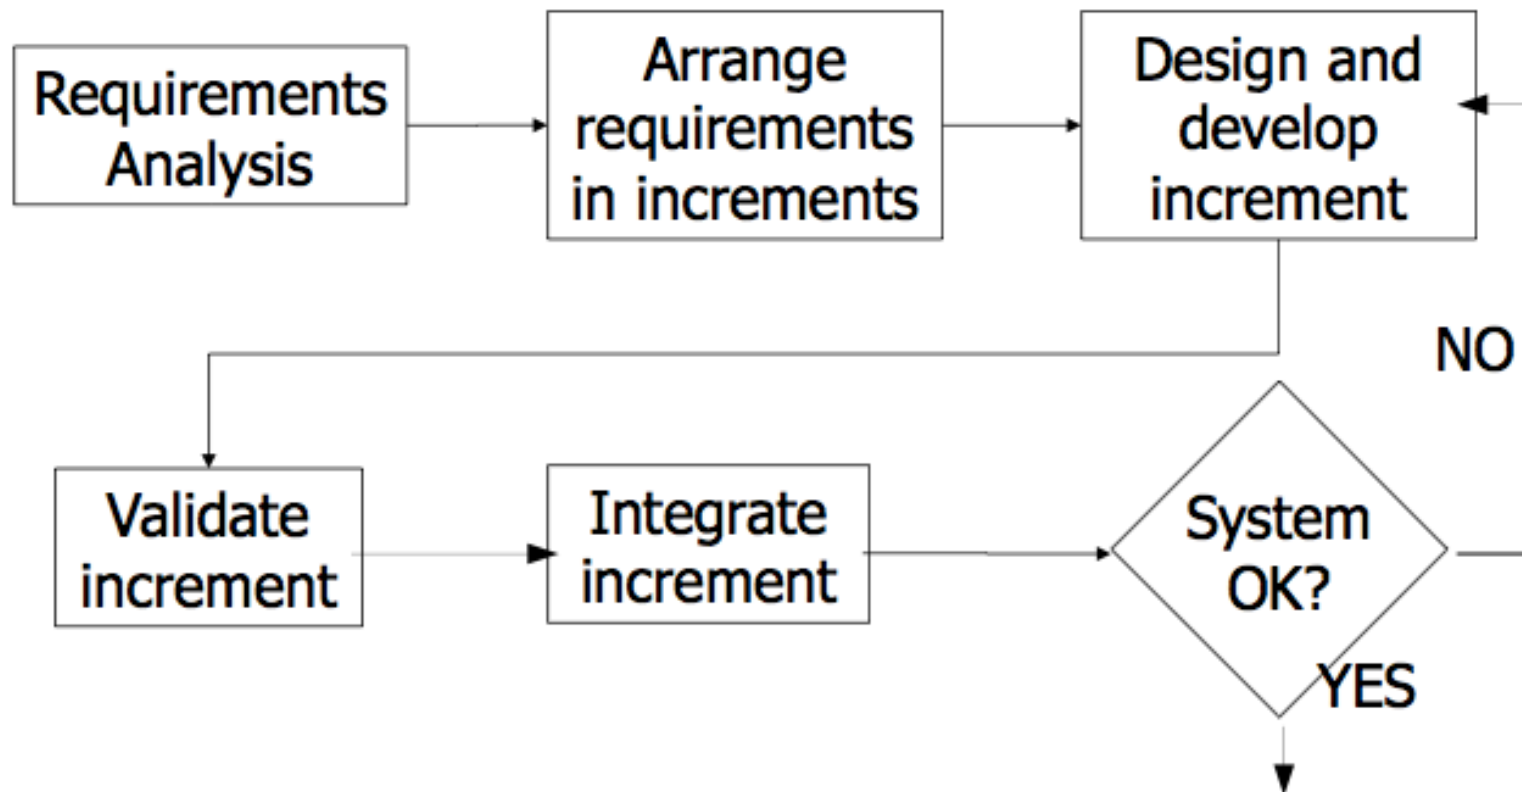

- ◆ **Partial working model**
  - ◆ **Vertical:** only some features are fully prototyped
  - ◆ **Horizontal:** all featured are prototyped but not in detail.

# Incremental Model

- ◆ Break the system into small components.
- ◆ Implement and deliver small components in sequence.
- ◆ Every delivered component provides extra functionality to the user.

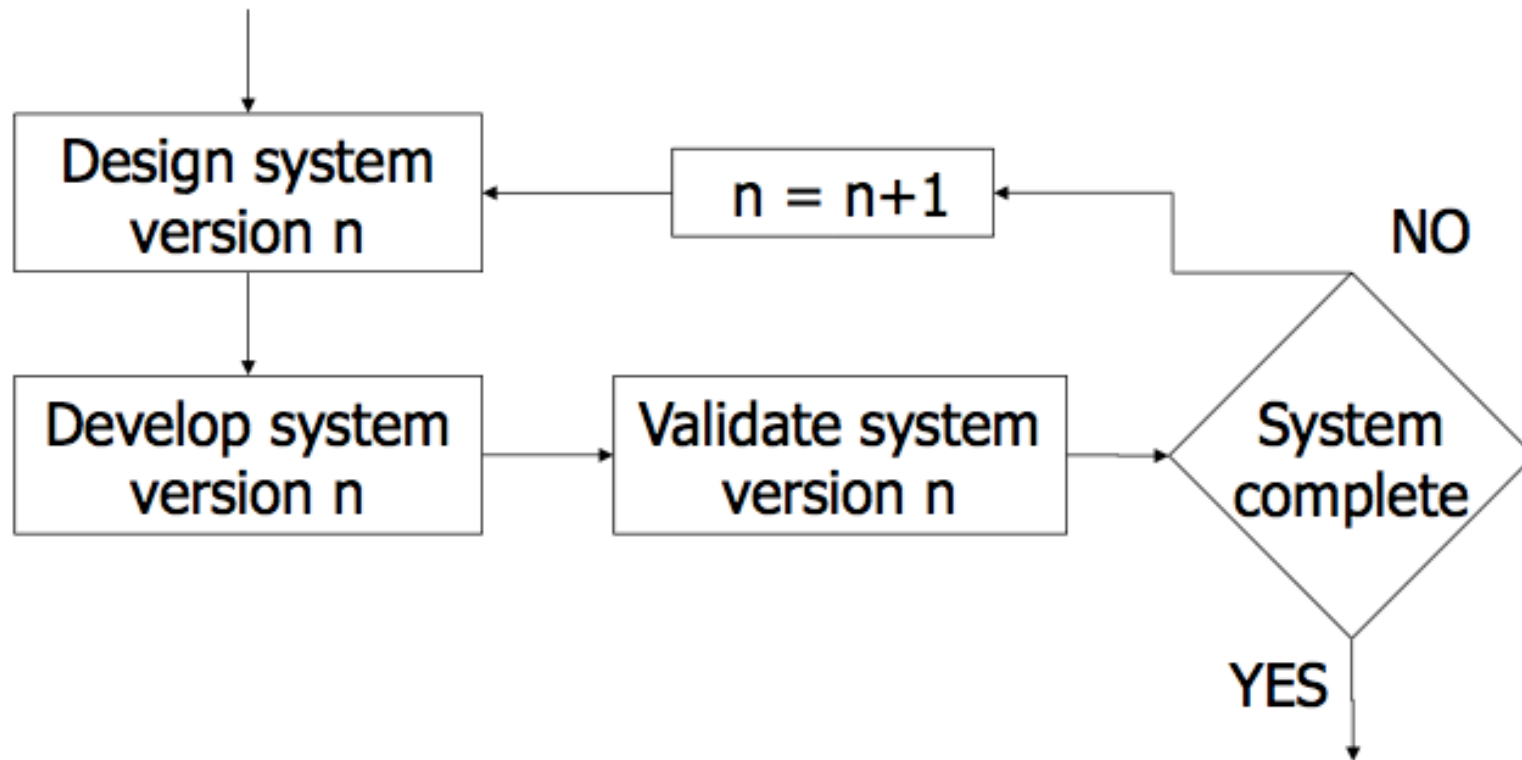

# Incremental Model (cont'd)

# Iterative Model

- ◆ Deliver full system in the beginning.
- ◆ Enhance existing functionality in new releases.

# Iterative Model

# Combined Incremental and Iterative Model

- ◆ **Every new release includes:**
  - ◆ extra functionality.
  - ◆ enhancement of existing functionality.

**Popularly used in software industry.**
